

❖ Linux - How to check which ports are listening in my Linux server?

- By use the netstat command:
 - The netstat command can be used to list all listening ports on a Linux server. To list all listening ports, open the terminal and type: `#netstat -tulpn` , This will show all the listening ports and the associated process ID (PID).
- Use the lsof command:
 - The lsof command can also be used to list all listening ports on a Linux server. To list all listening ports, open the terminal and type, `#lsof -i -P -n | grep LISTEN`, this will show all the listening ports and the associated process ID (PID).
